Questions & Answers About anatomy and physiology lecture notes

No	Question	Answer
1	What are the main functions of the human skeletal system?	The human skeletal system provides structure and support, facilitates movement by anchoring muscles, protects vital organs, stores minerals like calcium and phosphorus, and houses the bone marrow for blood cell production.
2	How do the different types of muscle tissues differ in structure and function?	There are three types of muscle tissues: skeletal muscles, which are voluntary and attached to bones; smooth muscles, which are involuntary and found in organs; and cardiac muscles, which are involuntary and make up the heart. Each type has distinct structural features suited to their functions.
3	What is the role of the nervous system in regulating body functions?	The nervous system controls and coordinates body activities by transmitting electrical signals between the brain, spinal cord, and nerves, allowing rapid responses to stimuli and regulation of functions such as movement, sensation, and homeostasis.
4	How does the respiratory system facilitate gas exchange?	The respiratory system enables gas exchange primarily in the alveoli of the lungs, where oxygen diffuses into the blood and carbon dioxide diffuses out. This process is vital for maintaining oxygen supply and removing metabolic waste gases from the body.

5	What are the key differences between the sympathetic and parasympathetic divisions of the autonomic nervous system?	The sympathetic division prepares the body for 'fight or flight' responses by increasing heart rate and dilating airways, while the parasympathetic division promotes 'rest and digest' activities, slowing heart rate and stimulating digestion, maintaining overall homeostasis.
